

## DOES NOMAFLEX® CONTAIN ANY VOLATILE ORGANIC COMPOUNDS (VOC'S)?

VOC's are organic gases or vapors that are present in some plastic products, and are emitted over time. VOC's are responsible for "new car smell", but also for the film that forms on the inside of your new car's windshield. Nomaflex contains little to no VOC's that could negatively impact the use of the product with either hot-pour or cold-applied sealants. Any VOC's that are created in the manufacture of Nomaflex products are actually evacuated during processing and storage before delivery to the customer.
