

RODLERBEAD™

CASING BEAD

SAVES LABOR

RodlerBead™ is used as a casing bead accessory to separate stucco from dissimilar materials such as windows, doors, vents, exterior trim and M.E.P. penetrations during stucco application.

DESCRIPTION

RodlerBead is a multi functional easy peel-and-stick product that has a built-in backer rod foam to create the space for sealant. After installing RodlerBead and screeding the stucco, simply peel off the protective sheeting, which also removes the top portion of the perforated foam. After the foam is removed, there is a perfectly sized void to be filled with sealant. RodlerBead will eliminate the additional steps, labor, and material required for traditional casing bead or J mold installations, **cutting the typical installation cost in half.**

INSTALLATION

RodlerBead terminates areas such as windows or doors when applying exterior coating materials. There is no cutting, measuring, stapling or nailing required, and RodlerBead incorporates a peel-and-stick tape for applying the product to the surface.

1. Remove blue liner

2. Apply to window or other siding penetration

3. Remove red liner

4. Apply protective sheeting

5. Install cladding. DO NOT COVER foam

6. Remove sheeting which will pull out perforated portion of foam

7. Fill void with sealant

Features

- Lowest installed cost
- Simple to install
- Sealant compatible
- No casing = less holes & less breaks
- Will not rust
- No separation of stucco from the casing bead
- Lightweight
- Waterproof
- Easy to handle
- Closed-cell backer rod
- Flexible
- Low abrasion
- Chemically neutral
- Recyclable
- Made in USA

Product Specification

- ASTM C926-20a Compliant
- ASTM C1063-20 Compliant

The user is responsible for testing materials for compatibility and proper installation of waterproofing measures in accordance with applicable building codes, industry best practices and all other manufacturers' requirements. The foam is an expansion joint material, not a stand alone waterproofing product.
